# **Assessment and Management of Older Patients with Metastatic Breast** Cancer (MBC) Among Community Oncologists in the US

Efrat Dotan<sup>1</sup>, Elizabeth Handorf<sup>2</sup>, Caitlin R. Meeker<sup>3</sup>, Bianca Lewis<sup>3</sup>, Kelly Filchner<sup>3</sup>, Jennifer S. Winn<sup>1</sup>, Lori J. Goldstein<sup>1</sup>

<sup>1</sup>Medical Oncology, <sup>2</sup>Biostatistics Department, <sup>3</sup>Fox Chase Cancer Center, Philadelphia, PA, United States

# METHODS

### Figure 1: Study Design

### Phase 1 Objectives:

Evaluate gaps that exist in community oncology practices in the care of older metastatic breast cancer (MBC) patients.

### Needs assessment:

Questionnaires, completed by physicians and other members of the care team, evaluating the approach to the treatment and management of the older MBC patient at each participating community site.

### Phase 2 Objectives:

Enhance the care of older MBC patients by increasing awareness of geriatric assessment (GA) tools through the implementation of an educational program.

- **Educational didactic session:**
- GA tools and their implementation in clinic.
- Case-based discussion of older MBC patient management.

### Educational pilot project:

- MBC patients ≥65 years old completed a patient-focused GA self-assessment.
- The provider will meet with the patient and recommend a treatment plan (Blinded to the patient's GA results).
- The formal report, which includes intervention recommendations based on scores, will be shared with the provider.

### **Figure 2: Sample Formal Report**

BMI	Weight Status
Below 18.5	Underweight
18.5 - 24.9	Normal or Healthy Weight
25.0 - 29.9	Overweight
30.0 and Above	Obese

Patient's BMI requires an immediate intervention. BMI scores in this category are associated with a decline in health function and increased risk for treatment toxicity. Please speak with this patient about their nutritional habits, and refer them for a nutrition consult by a Registered Dietician (RD) or Nutritionist. Specific dietary recommendations, supplements, or a referral to social work may also be beneficial

Charlson Comorbidity Index				
Low	0 points			
Medium	1 to 2 points			
High	3 to 4 points			
Very High ≥5 points				

### Patient Scored: 2

Patient's CCI warrants a suggested intervention. Patients that score in this range are at intermediate risk for mortality. Please speak with this patient about their comorbidities, to ensure that they are being treated and monitored effectively.

≥26 Normal				
≤25 Cognitive Impairment				

Assessment	<u>Score</u>	Action
ECOG PS	1	No Intervention Required
Evidence of Weight Loss (in the past 6 months)	12%	Immediate Intervention Required
BMI	17.2	Immediate Intervention Required
Charlson Comorbidity Index	2	Intervention Suggested
Montreal Cognitive Assessment (MoCA)	23	Immediate Intervention Required
Timed Up and Go	10.08	No Intervention Required
Number of Falls (in the past 6 months)	1	Immediate Intervention Required
Activities of Daily Living Subscale (ADL)	2	Immediate Intervention Required
Instrumental Activities of Daily Living Subscale (IADL)	4	Immediate Intervention Required

S,

 $\square$ 

• Evaluation of the providers' perspective of these results: "Did this change your management?"

Patient's MoCA score requires an immediate intervention. Patient's ability to provide informed consent should be assessed, and a health care proxy should be identified. Referral to Social Work should be made. Patient may benefit from further cognitive testing or a referral to neuropsychological or geriatric services. Patient's medications should also be assessed.

Geriatric Depression Scale	7	Intervention Suggested
MOS Social Support Scale	2	Immediate Intervention Required

## RESULTS

### Table 1: Provider Demographics

### Table 2: Pre-Intervention Providers Assessment Methods for Older MBC Patients

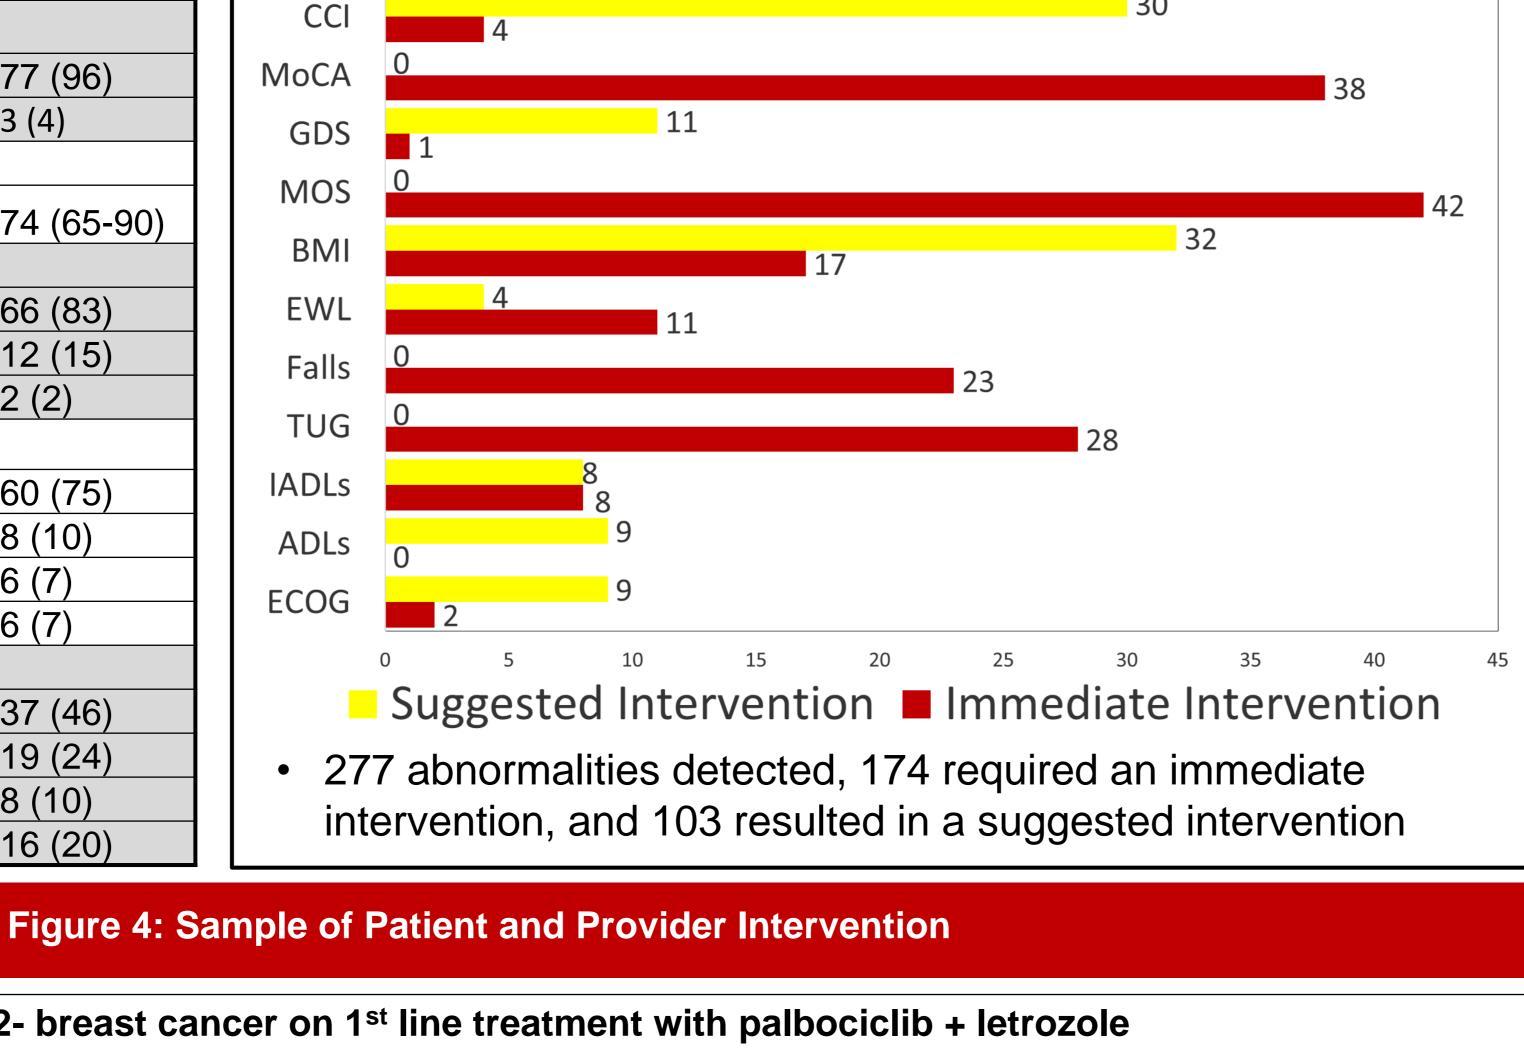

Characteristic	N=43	Characteristic (cont'd)	N (%)
Gender	N (%)	Years in Practice	
Female	23 (53)	<5	16 (37)
Male	20 (47)	5 - 10	12 (28)
Age		11 - 15	9 (21)
30 – 40	16 (37)	> 15	
41 – 50	12 (28)	Prior experience in Geriatri	CS
>50	9 (21)	Yes	2 (5)
Race		GA is beneficial	
Caucasian	25 (58)	Agree	33 (77)
Asian	14 (33)	Use GA regularly	18 (42)
Role		% of MBC pts ≥ 70	
Physician	37 (86)	≤ 40 %	31 (72)
Physician extender	6 (14)	> 40%	12 (28)

	Routinely assess prior to treatment			Provider Current Approach		
	N (%)			N (%)		
	Agree	Neutral	Disagree	Validated Scale	<b>Patient Interview</b>	None
Fitness for treatment	ECOG F	PS assessed in	n all patients	29 (68)	14 (32)	0 (0)
Cognition	33 (77)	33 (77) 7 (16) 3 (7)			26 (60)	7 (16)
Depression	29 (68)	7 (16)	7 (16)	6 (14)	28 (65)	9 (21)
Socioeconomic status	28 (65)	6 (14)	9 (21)	7 (16)	25 (58)	11 (26)
Fall risk	33 (76)	5 (12)	5 (12)			
Nutritional status	37 (86) 2 (5) 4 (9)		19 (44)	17 (40)	7 (16)	
Comorbidities	42 (98)	0 (0)	1 (2)	0 (0)	40 (93)	3 (7)
Toxicity Risk				4 (9)	0 (0)	39 (91)

Results from the Needs Assessment identified the patient interview as the preferred method of assessing patients prior to treatment. Validated scales are used less frequently.

### care of older patients with metastatic breast cancer Strongly Agree 13 (16) 46 (58) Agree 15 (19) Neutral

# CONCLUSIONS

- Despite acknowledgement of the value associated with pre-treatment GA, most providers in the community do not routinely conduct such an assessment. Furthermore, most providers use interview rather than validated assessment tools to identify age related treatmentaltering concerns.
- In preliminary phase II results with 80 patients, the GA identified a large number of deficient areas that had not been identified through the physician's assessment, and resulted in change to the management of these patients.
