Introduction

- High-density lipoproteins (HDL) protects against atherosclerotic plaque formation
- Beta2-microglobulin (beta2M) is accumulated in the circulation of dialysis patients.

AIM

We examined the relationship between HDL serum concentrations, beta2M and markers of inflammation in dialysis patients

Methods

We studied :

- 96 dialyzed patients (62 males/34 females) on mean age $62,1 \pm 14,27$ years old and
- 24 healthy controls

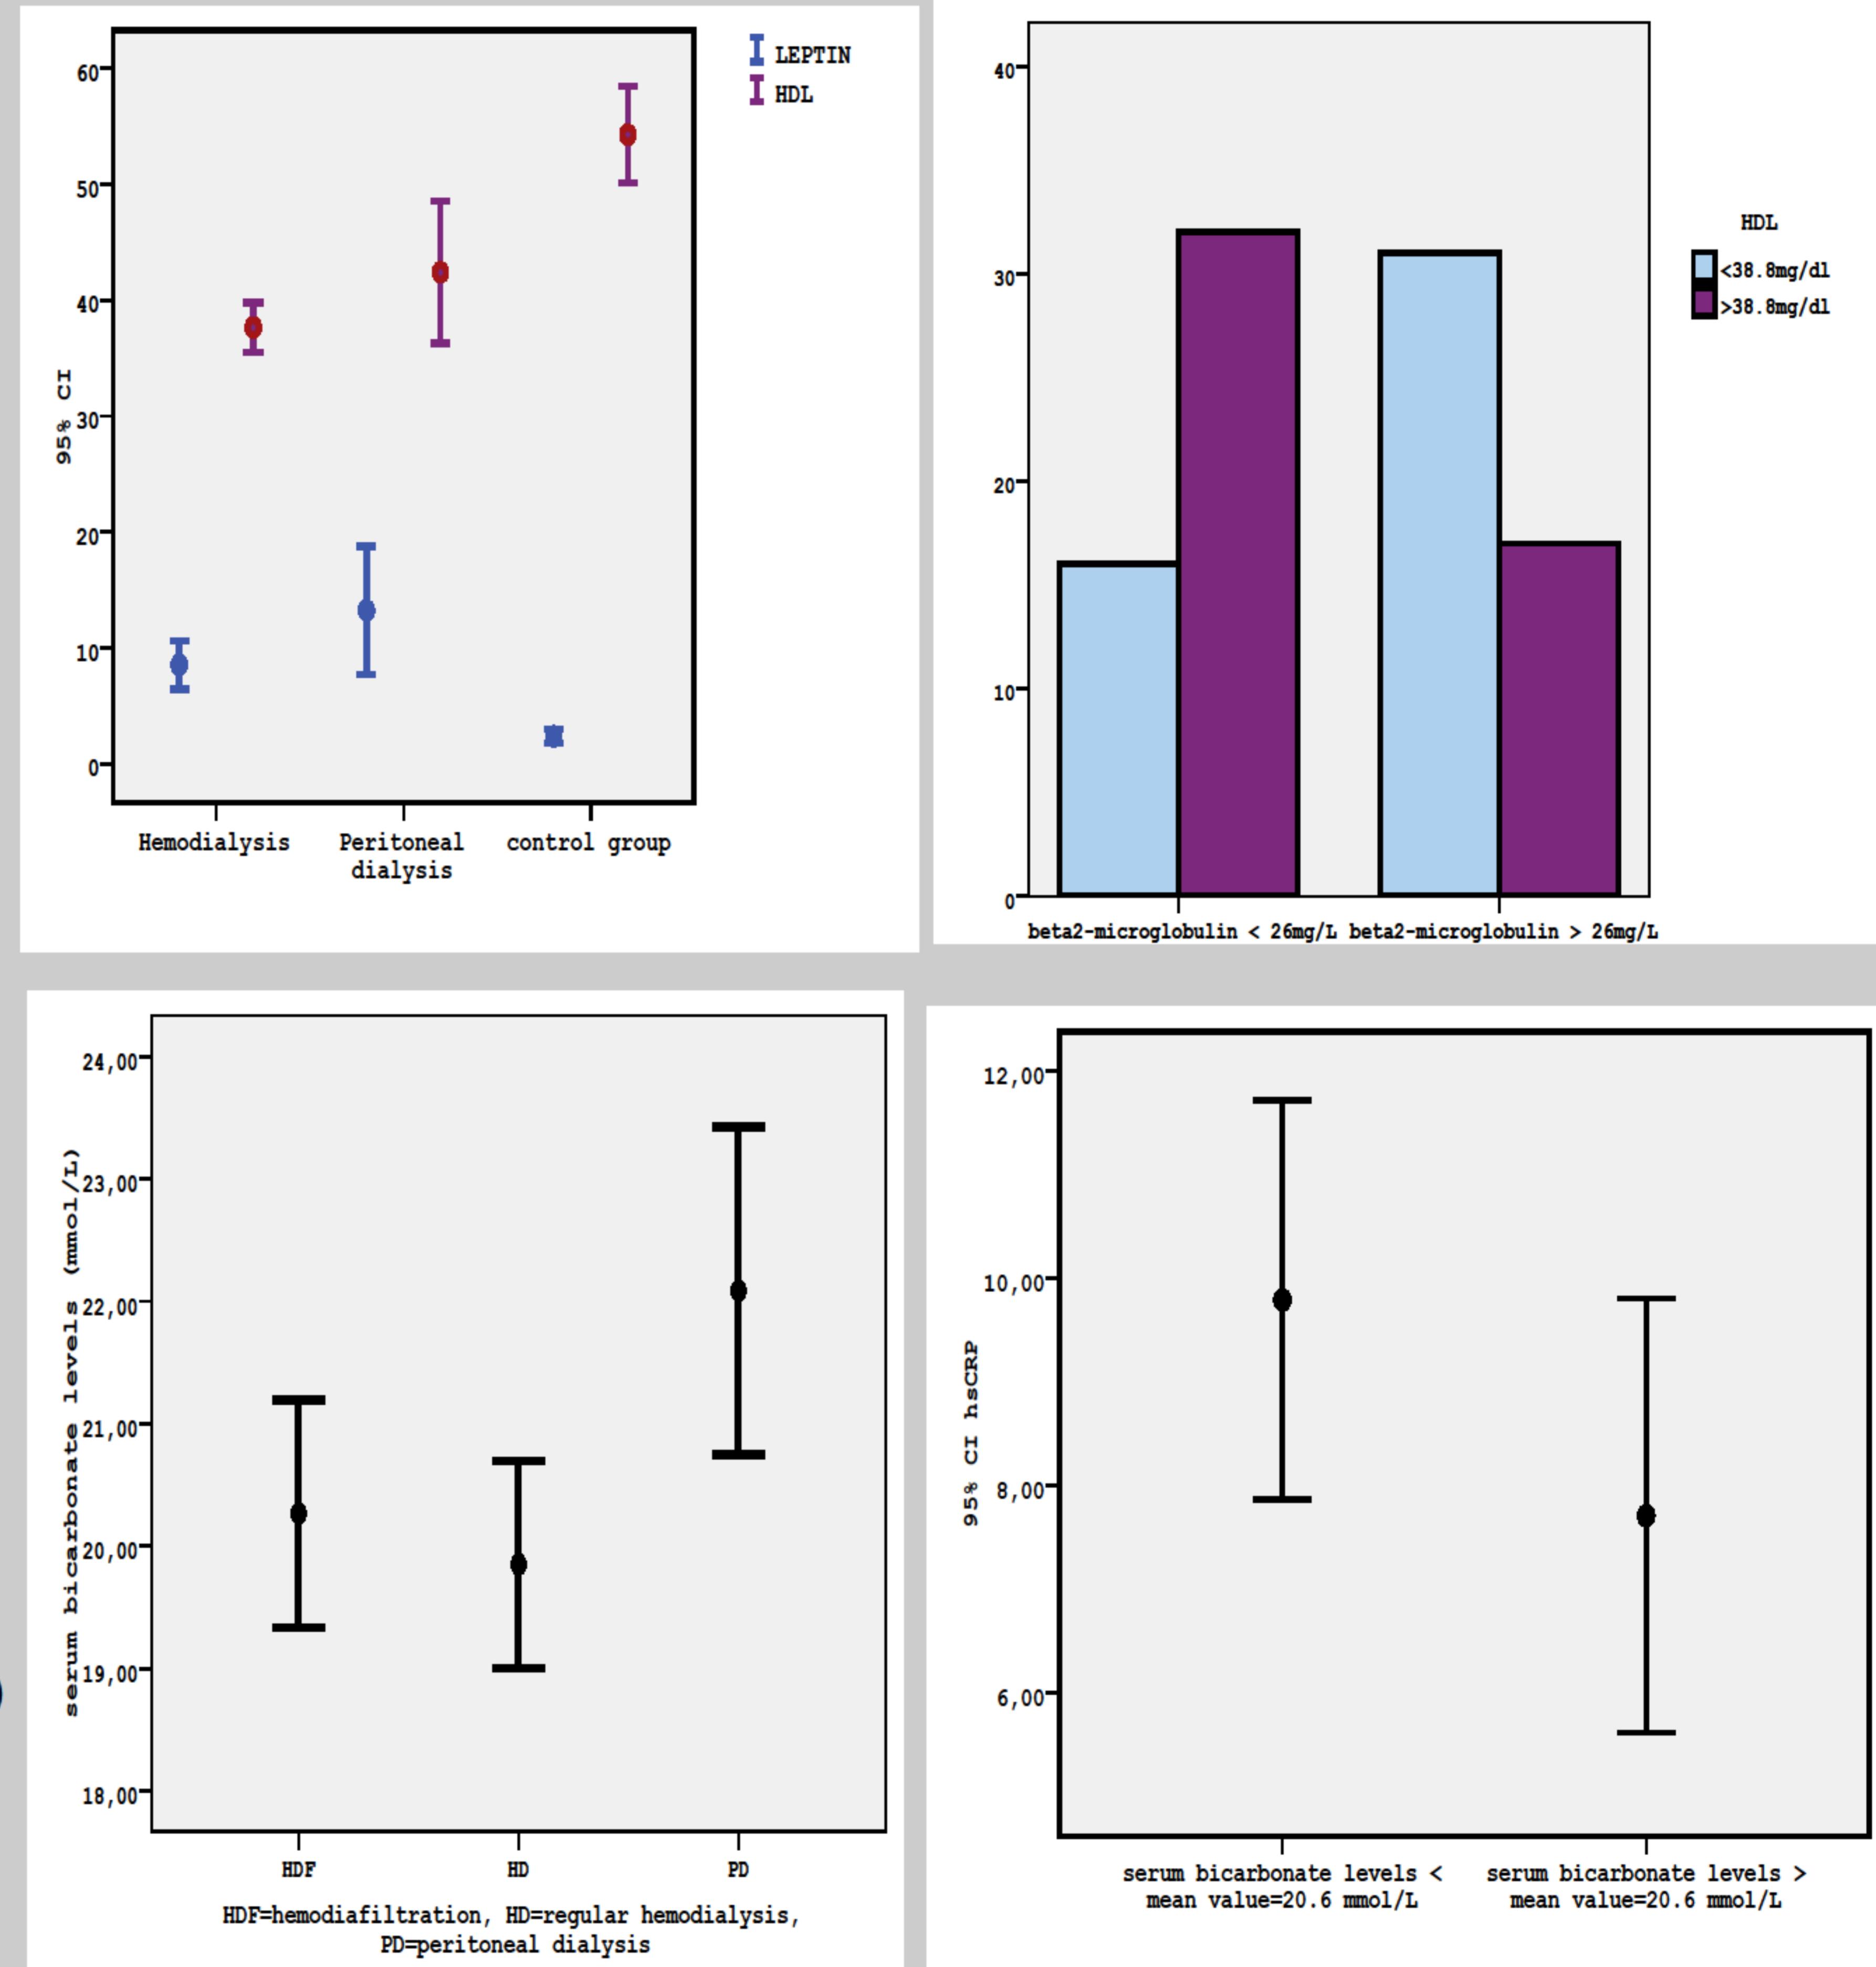

Treatment modalities :

- Regular hemodialysis (**HD**, n=34)
- Predilution hemodiafiltration (**HDF**, n=42)
- Peritoneal dialysis (**PD**, n=20)

We measured :

- Kt/V for urea
- serum bicarbonate levels
- Cholesterol, triglycerides, HDL, LDL
- hsCRP by ELISA
- Beta2M and leptin by radioimmunoassays

RESULTS

Conclusions

- The low HDL was associated with increased beta2M concentrations in patients on renal replacement therapies.
- The HDL reduction was lower in PD patients compared to hemodialysis modalities patients.
- The acidosis state influenced the inflammatory environment
