Introduction

- Identification of pre-transplantation (pre-Tx) donor factors associated with recipient outcomes may help to improve prognosis after kidney transplantation
- The extent of tubulo-interstitial damage is a strong prognostic determinant after kidney transplantation
- Tubular injury reduces NaPi cotransporters and phosphate transport

Objective

To investigate whether pre-Tx parameters of phosphate metabolism in living donors are associated with recipient outcomes after transplantation

Methods

In living kidney donors ($n=130$) **before transplantation**, we determined renal function (^{125}I -iothalamate GFR), NGAL and KIM-1, and several parameters of phosphate metabolism including TmP-GFR (tubular maximum phosphate reabsorption per GFR):

$$\text{TRP} = 1 - ((\text{Uphosphate} / \text{Pphosphate}) * (\text{Pcreatinine} / \text{Ucreatinine} * 1000))$$

- If TRP was ≤ 0.86 , TmP-GFR was calculated as:

$$\text{TmP/GFR} = \text{TRP} * \text{Pphosphate}$$

- If TRP was > 0.86 , TmP-GFR was calculated as:

$$0.3 * \text{TRP} / (1 - (0.8 * \text{TRP})) * \text{Pphosphate}$$

Primary outcome: GFR (^{125}I -iothalamate) in matched recipients at 1 year post-Tx

Associations between pre-Tx donor factors and recipient post-Tx GFR were tested by multivariate linear regression

	St. Beta	P value
Serum phosphate	0.75	<0.001
Urine phosphate	-0.39	<0.001
PTH	-0.27	0.002

Table 2: Multivariate determinants of TmP-GFR

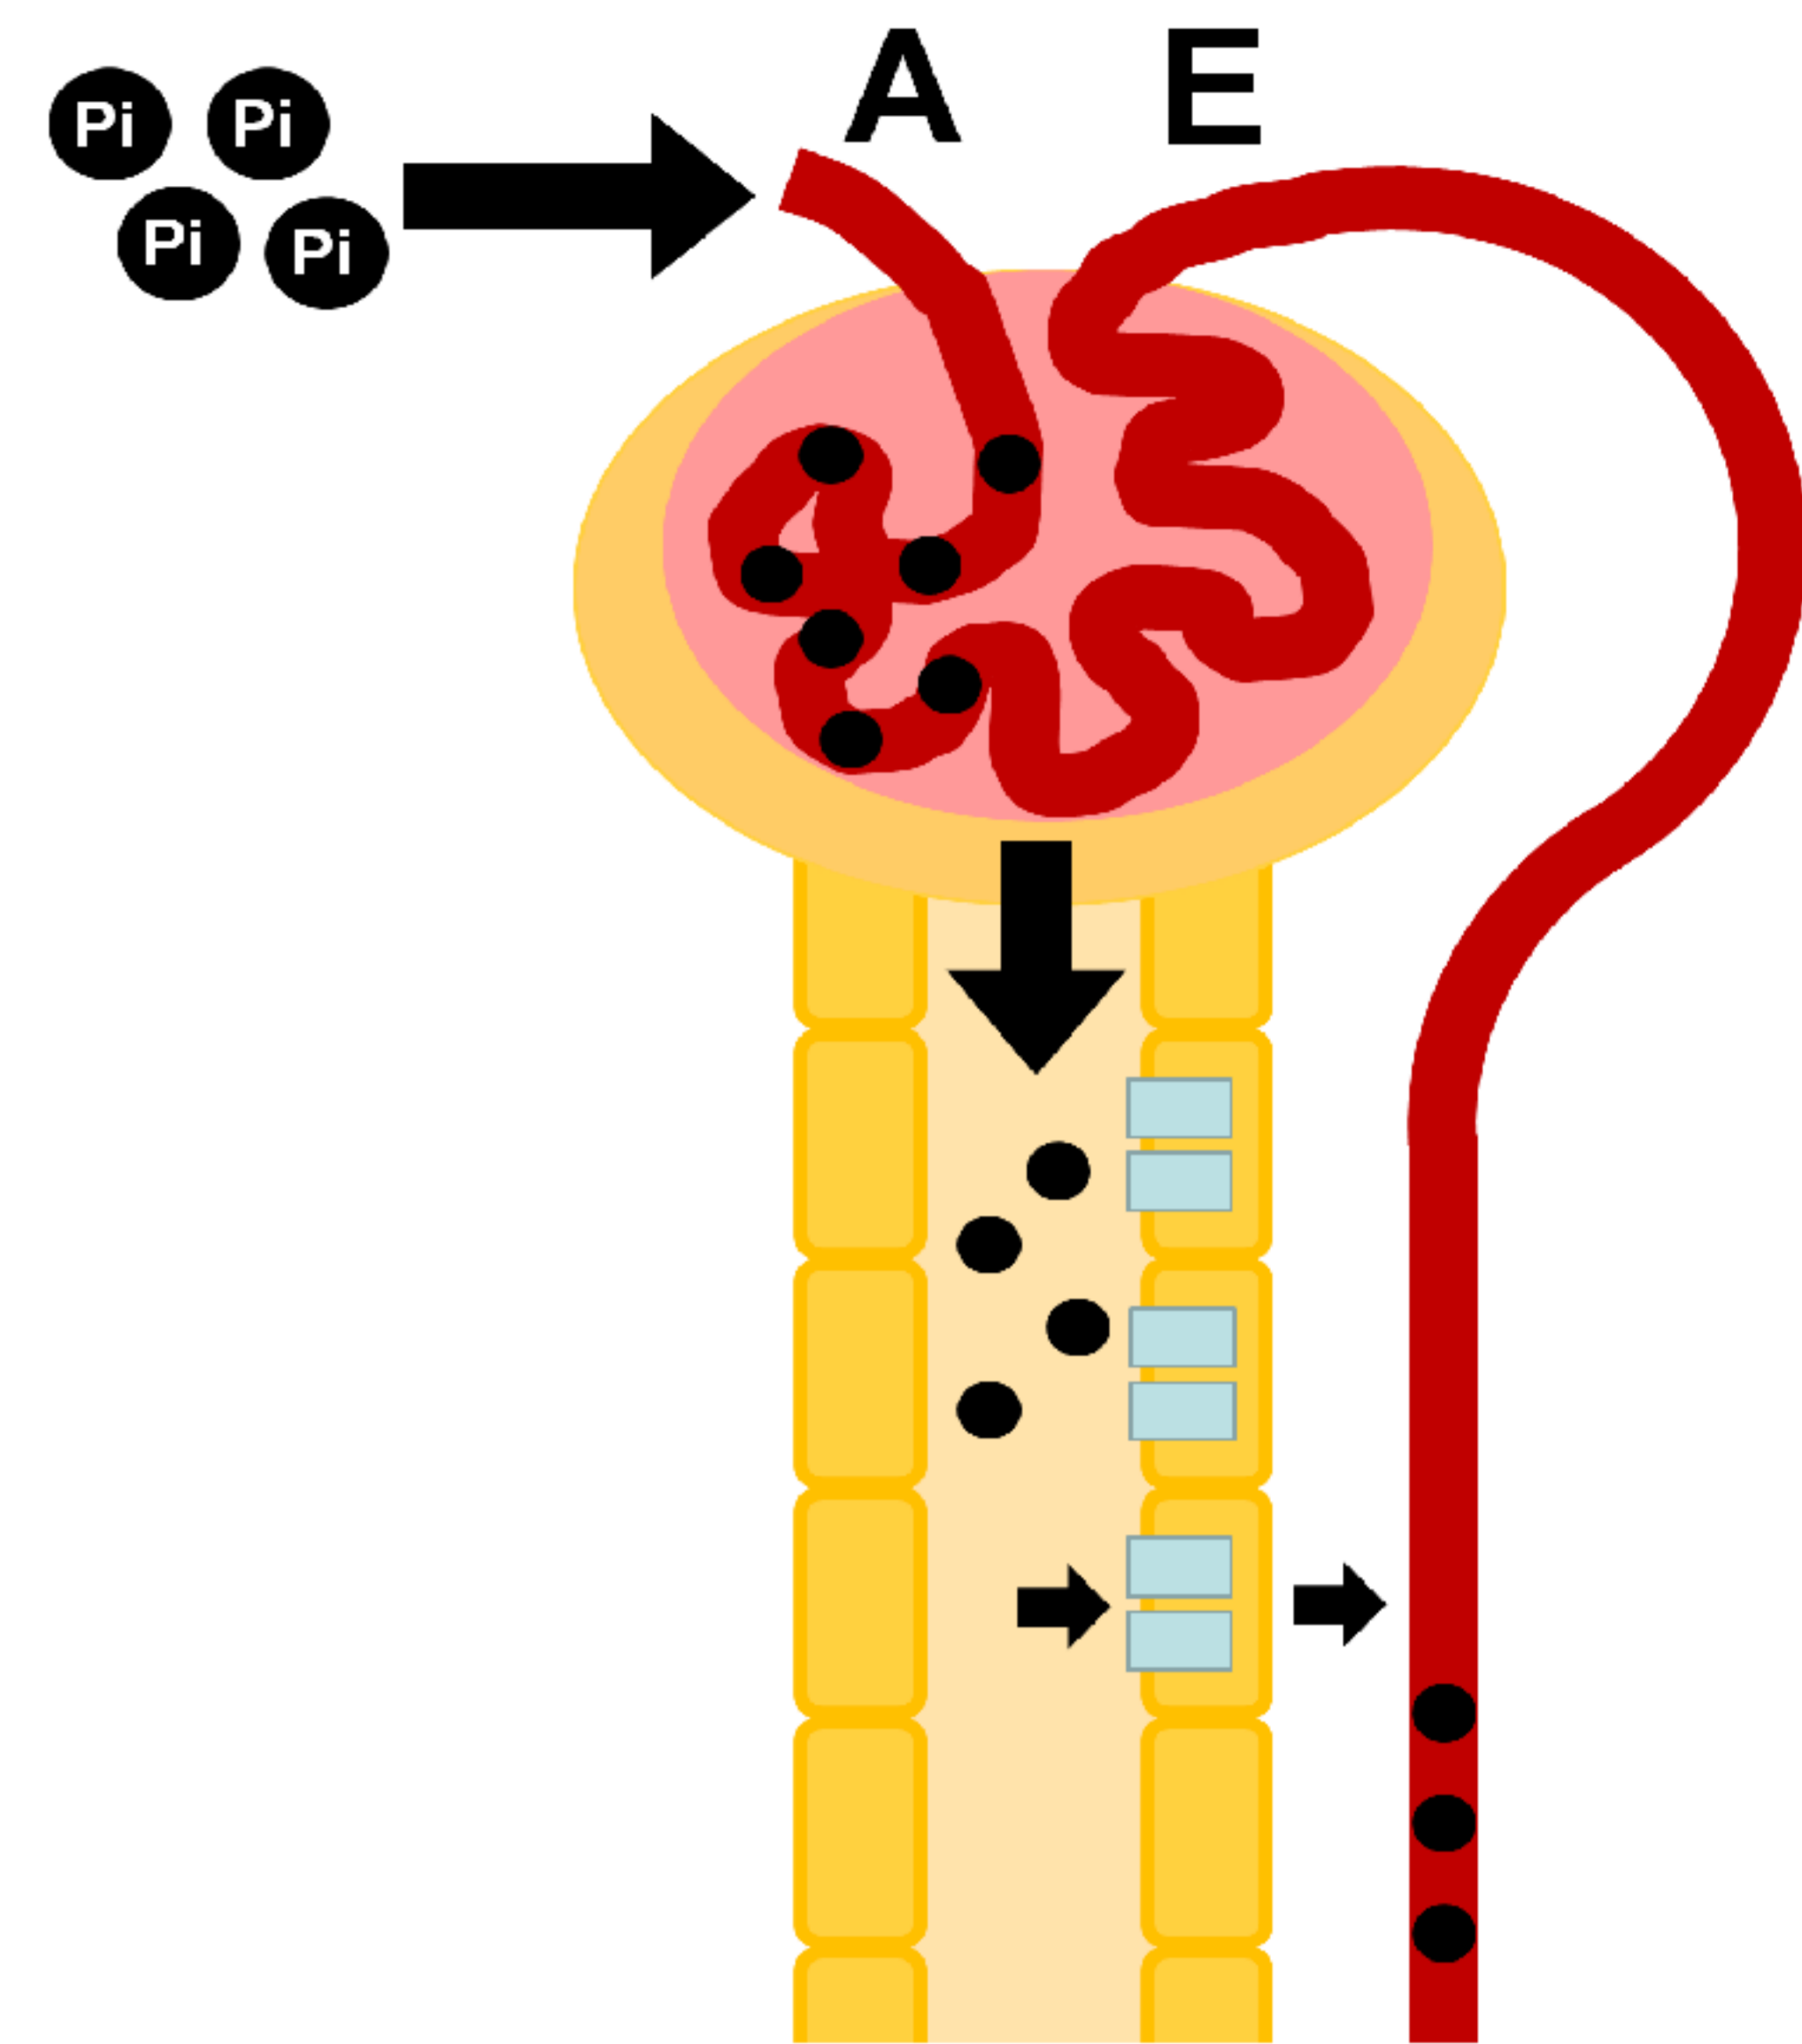

Fig 1: Renal phosphate handling

Results

	Recipient GFR 1 yr post-Tx	
	St. Beta	P
Donor pre-Tx TmP-GFR	0.28	0.000
+ donor age and gender	0.24	0.003
+ donor predonation GFR	0.23	0.003
+ donor predonation SBP	0.22	0.005
+ donor predonation PTH, FGF23	0.25	0.01
+ recipient age, gender	0.27	0.02
+ LR vs LUR	0.28	0.01

Table 1: Multivariate regression: consistent association between donor pre-Tx TmP-GFR and recipient post-Tx GFR

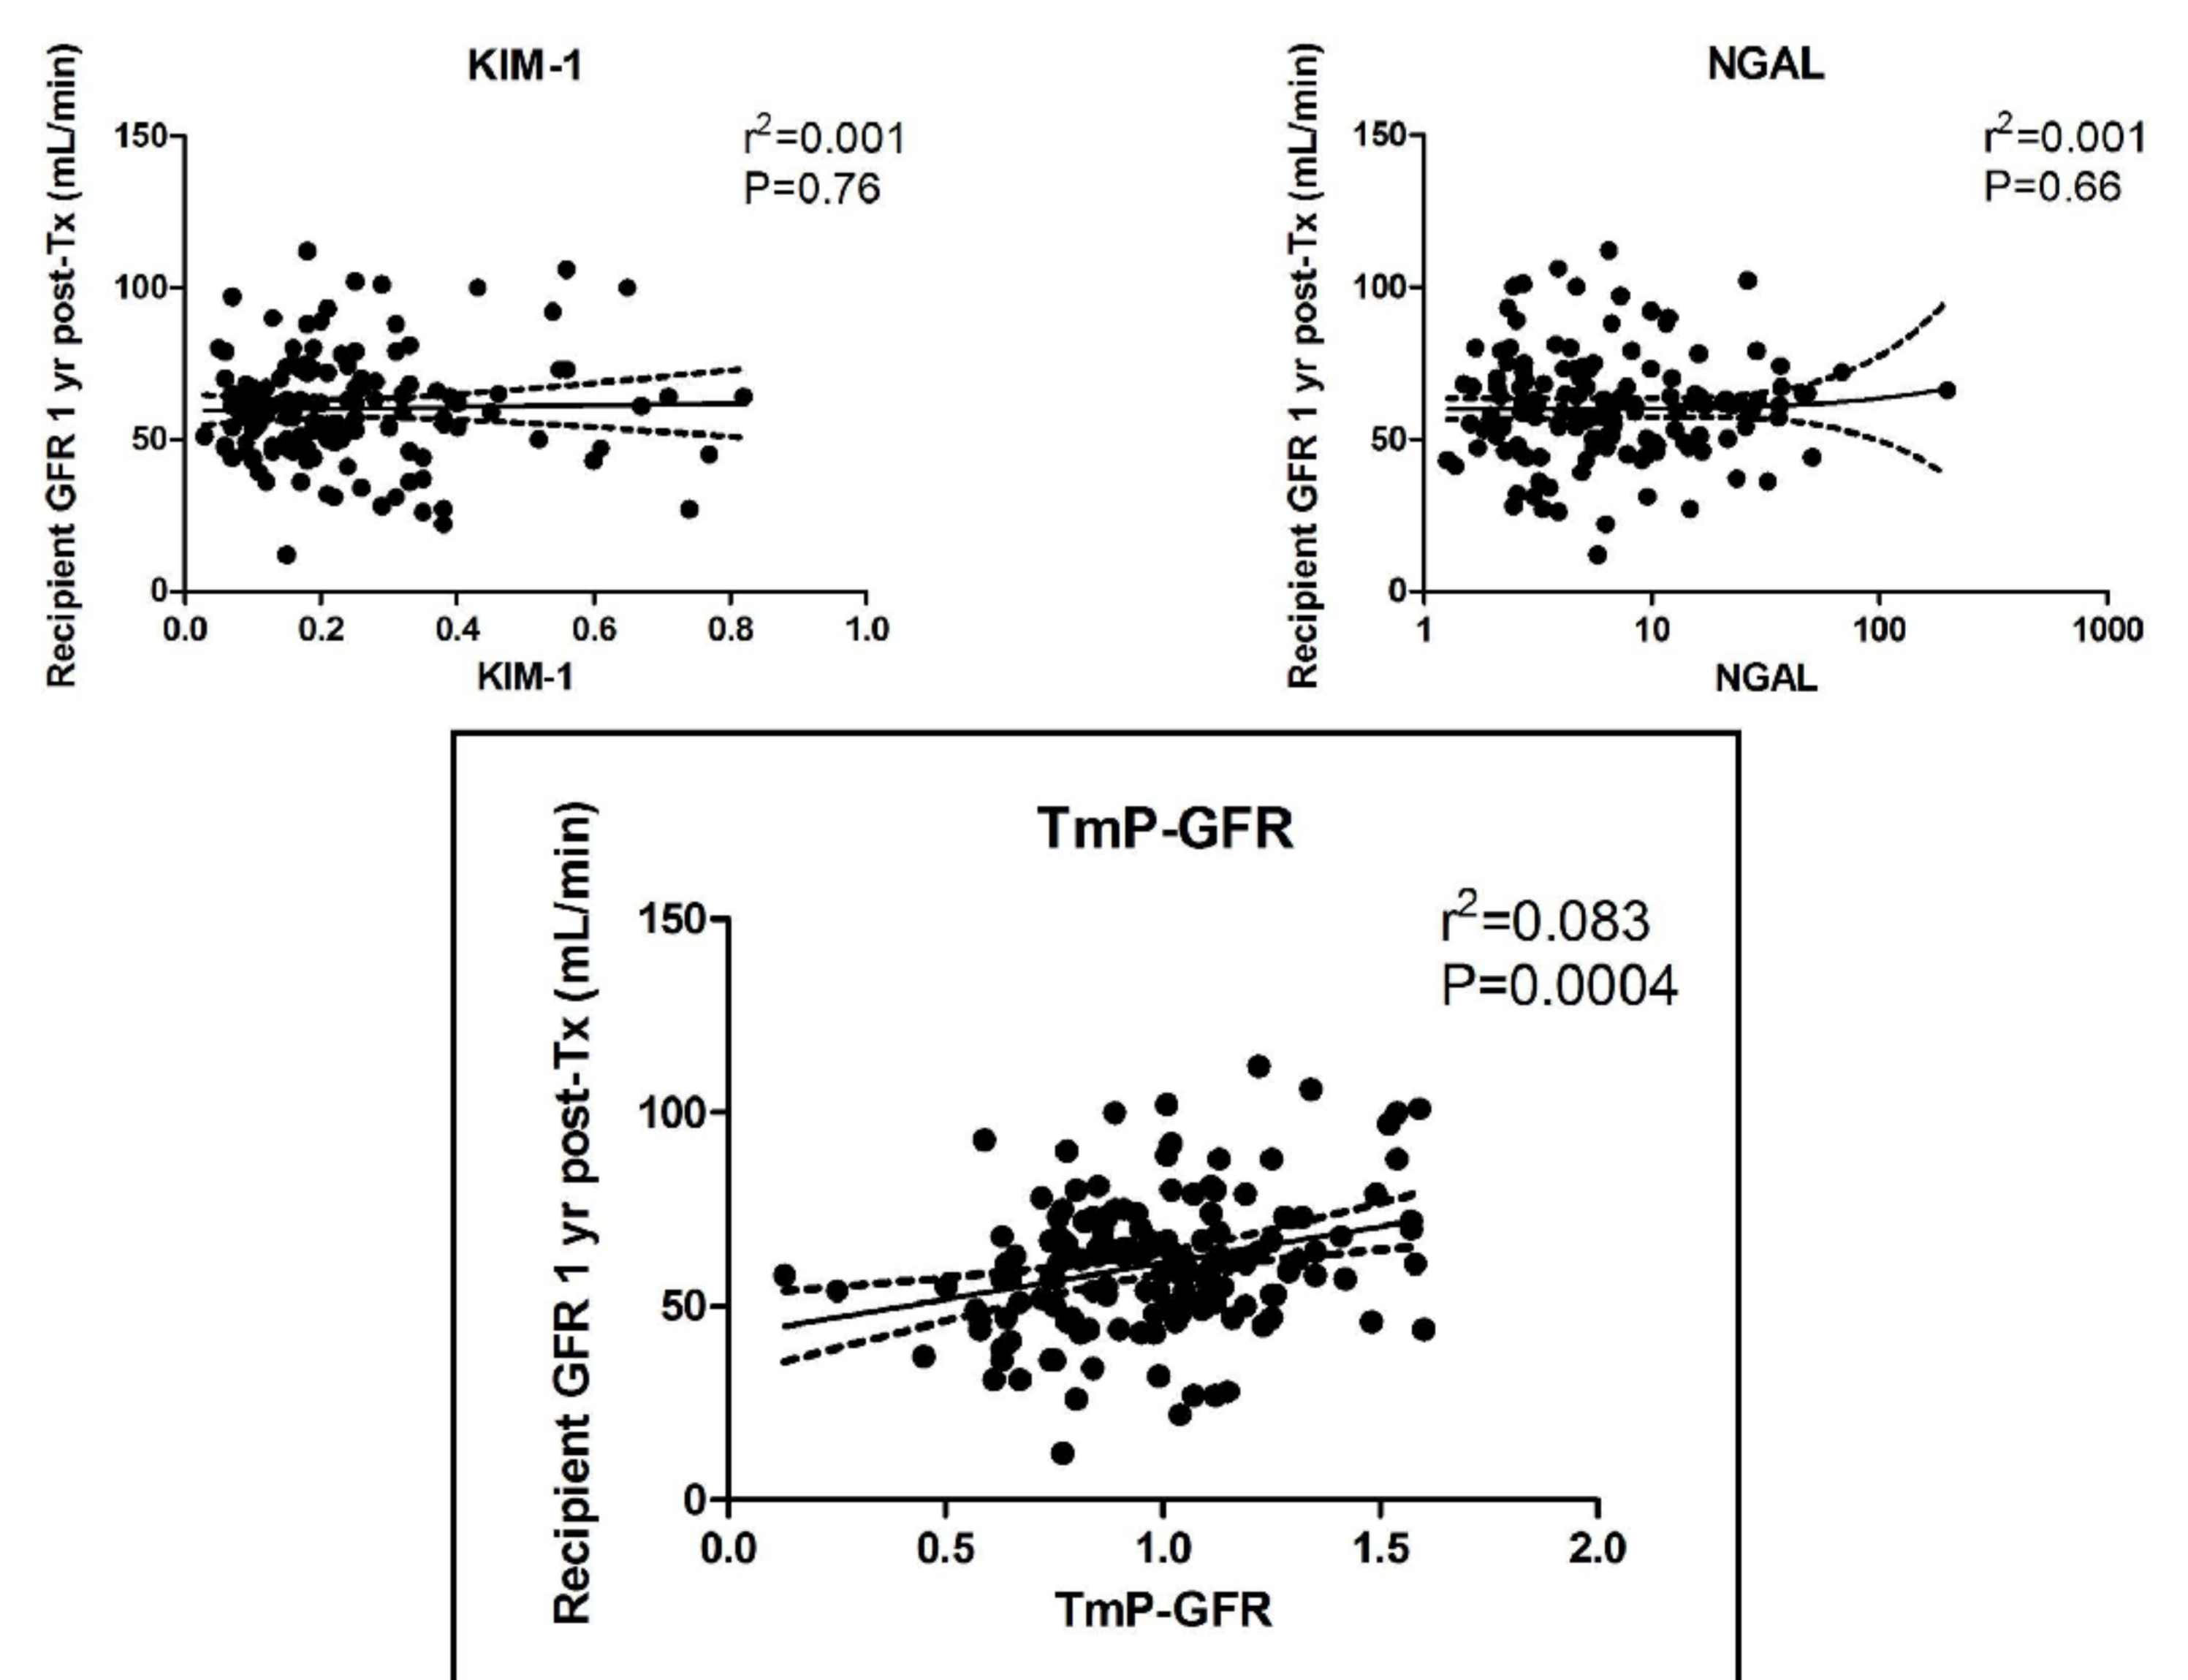

Fig 2: Donor pre-Tx TmP-GFR, but not KIM-1 or NGAL, are associated with post-Tx recipient GFR

Conclusion:

To our knowledge, donor predonation TmP-GFR is the first functional tubular marker that can predict recipient outcome after transplantation, independent of recipient age and GFR
