MP724

Renal transplantation. Clinical.

## INTRODUCTION

- Kidney Transplantation – greatest potential for restoring a healthy productive life;
- Immunosuppression → higher risk for infection
- Infection is the most frequent cause of death in non-cardiac intensive care units (ICU)

## RESULTS

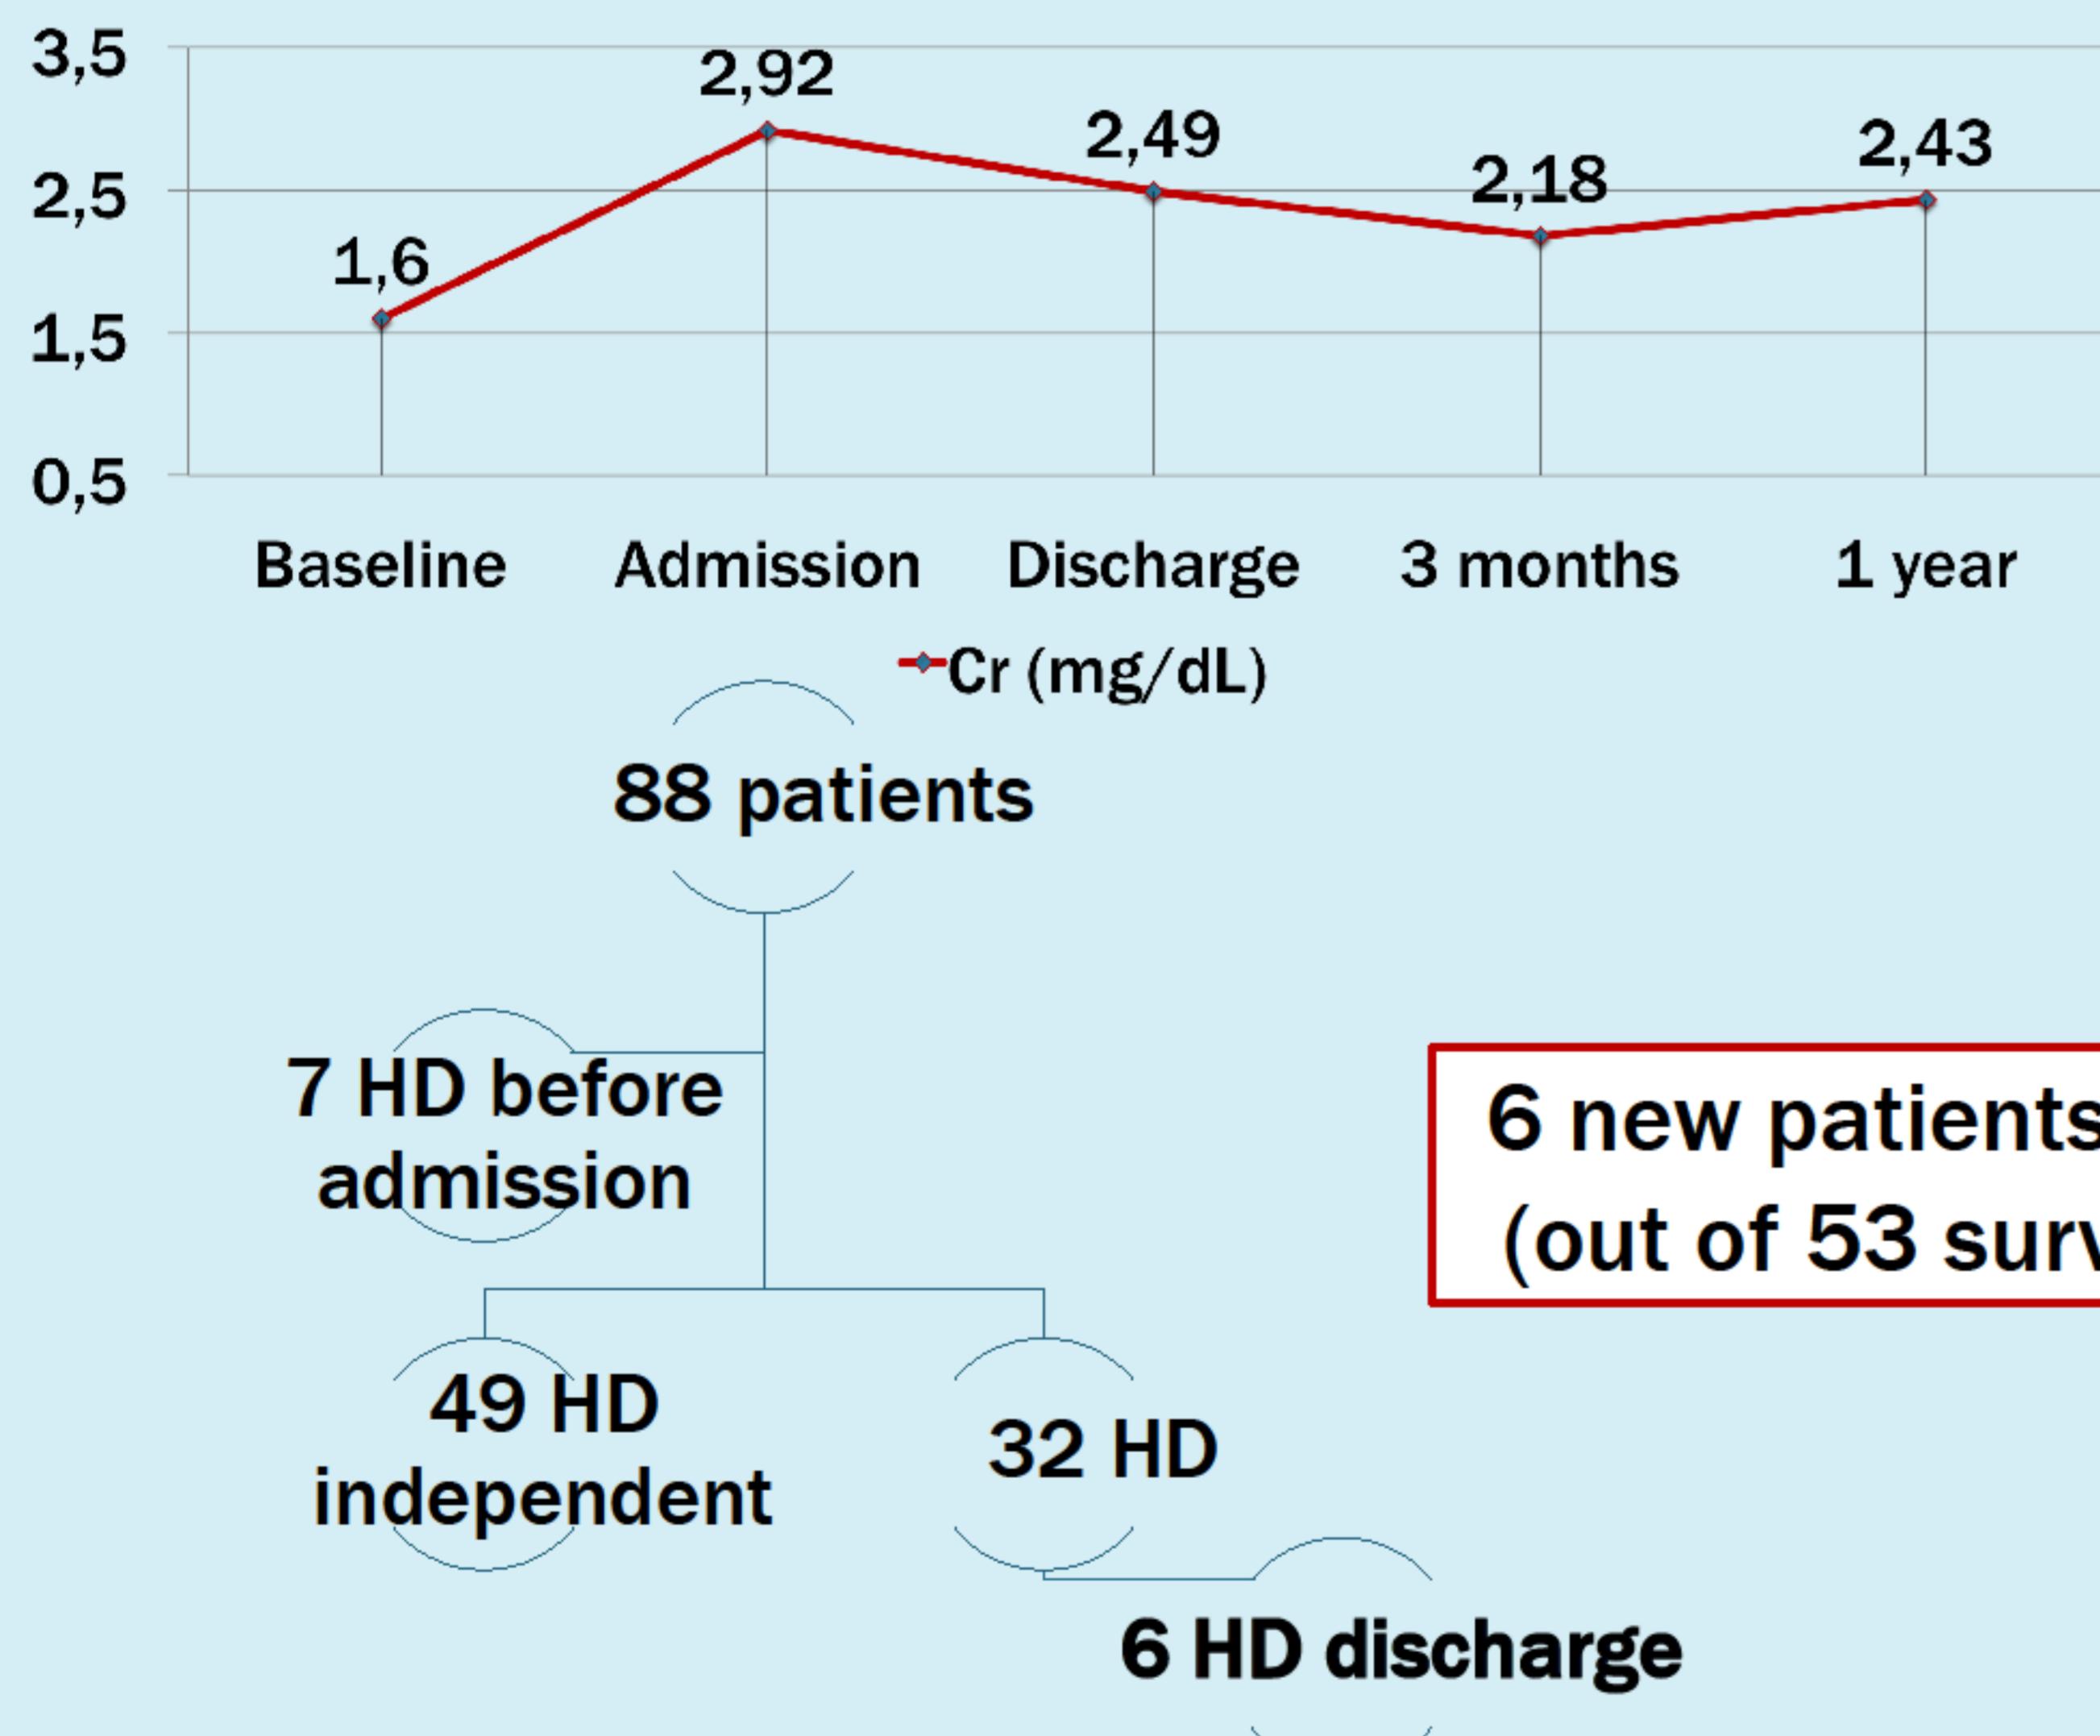

### 11 years → 88 kidney transplant patients admitted in UCI

MALE	64%
AGE (mean)	54 (+- 13,6) years
CADAVER DONOR	99%
1 <sup>ST</sup> TRANSPLANT	90%
EXPANDED CRITERIA	48%
POST-TRANSP TIME	38,7 months (median)
INDUCTION	64% Basiliximab
MAINTENANCE	54% steroids + calcineurin inhibitors + MMF

### ADMISSION CAUSE → 86% INFECTION

RESPIRATORY	47%
Nosocomial pneumonia	N=24
Community-acquired pneumonia	N=10
URINARY	21%
Urinary tract infection	N=13
Peri-graft abscess	N=3
ABDOMINAL	17%
Intestinal ischaemia	N=6
Intestinal perforation	N=2
OTHER	15%

### Graft outcome

## OBJECTIVES

### RENAL TRANSPLANT PATIENTS ADMITED TO AN ICU

- Demographic data
- Infectious complications
- Graft outcome
- Patient outcome
- Mortality predictors

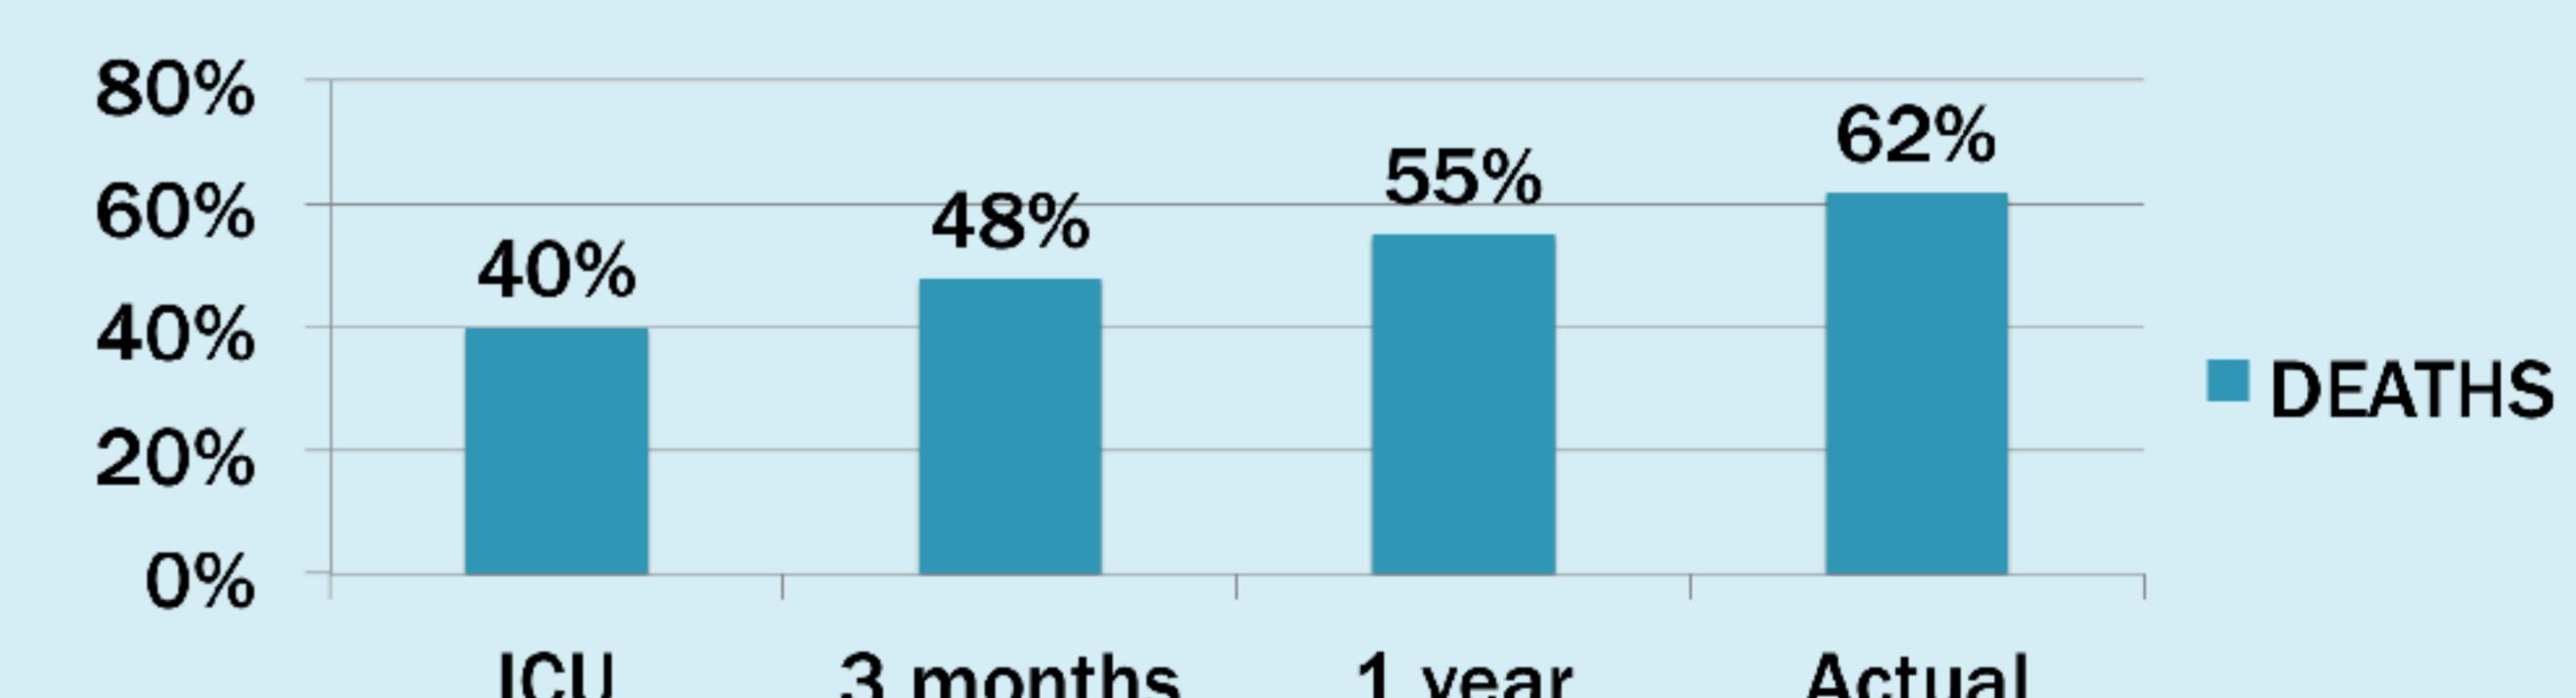

## MATERIALS AND METHODS

- 11-year retrospective observational study of all the renal transplant patients admitted to an ICU
- Convenience sample
- SPSS v. 23 for Mac (SPSS, Chicago, IL, USA)

## MICROBIOLOGY

RESPIRATORY SAMPLES	N
<i>Pseudomonas aeruginosa</i>	5
<i>Pneumocystis jirovecii</i>	4
<i>Acinetobacter baumanii</i>	3
Fungos ( <i>Candida, Aspergillus</i> )	4
<i>Staphylococcus aureus</i>	2
<i>Influenza H1N1</i>	1
URINARY SAMPLES	N
<i>Escherichia coli</i>	8
<i>Klebsiella pneumoniae</i>	6
<i>Pseudomonas aeruginosa</i>	1
ABDOMINAL SAMPLES	N
<i>Enterococcus faecium</i>	2
<i>Pseudomonas aeruginosa</i>	2
<i>Bacteroides fragilis</i>	1
<i>Escherichia coli</i>	1
<i>Staphylococcus aureus MR</i>	1

### Patient outcome

## MORTALITY PREDICTORS

	Survivors (N=53)	Death (N=35)	p	Odds Ratio	95% CI
Post-tx time>1 year	37 (70%)	19 (54%)	0,14		
Admission Cr (mg/dL)	2,8	3,5	0,07		
Dialysis in UCI	17 (32%)	22 (63%)	0,04	31,8	3,6-280
Septic shock UCI	56 (63%)	27 (51%)	0,01	8,13	1,4-48

## CONCLUSIONS

- The main cause for ICU admission is infection, with septic shock, mainly from respiratory infection;
- The presence of septic shock in admission represents an increased mortality risk of 8 times;
- The need of dialysis during admission in UCI increases mortality risk 31 times;
- Mortality rate in kidney transplant patients admitted in UCI is about two folds higher than general population;
