**OBJECTIVES.** von Willebrand **INTRODUCTION** / disease (vWD) is highly sub-diagnosed in Mexico because the required tests are complex and mostly unavailable across the country.

This study aims to diagnose vWD patients from Western Mexico by screening and confirmatory tests whose results will be confirmed in a further stage by complimentary proofs and genetic testing.

# **MATERIAL AND METHODS.**

**RESULTS.** After obtaining consent letter, 203 patients were recruited (112 women, 91 men), aged from 1 to 80 years old, from 203 independent families (63% familial cases; 37% sporadic). They were referred because of mucocutaneous bleeding or asymptomatic with abnormal clotting times. 203 index cases were studied (126 pediatric, 67 adults). Screening and confirmatory tests were performed to obtain the diagnosis of VWD types (table 1). 153 patients (76%) had O blood group, in contrast to general Mexican population (63%), (p=0.024). Affected population was diagnosed by the screening tests and the ratio vWF:RCo/vWF:Ag and other clotting and platelets disorders were discarded (figure 1).

\* Hemorrhagic scale was assessed according to Federici (2004), and based on it, we established a scale of \*\*Clinical Severity: asymptomatic (0 points); mild (1-3); moderate (4-9); severe (10-30). Average values and (range) of the diagnosis parameters are shown for each vWD type with their significance value (p).

Figure 1. Distribution of vWD diagnosis of patiens Mexican according to vWF:Rco/vWF:Ag ratio and screening testing. vWD type 2 was considered with a ratio < 0.7, and there were identified by vWF multimer analysis subtypes 2A, 2B and normal patterns (probable 2M or type 1). Type 3 cases were also confirmed with the complete vWF absence.

**CONCLUSION:** The excess of vWD patients with O blood group confirms a higher bleeding risk related to this hemotype that is predominant in Mexican population. vWF multimers analysis only discriminates severe vWD type 1, vWD 3 and 2A subtype while the 2B, 2M, and 2N subtypes require additional tests and even genetic testing for final confirmation.
